Power System Status Restoration and Power Related Updates

Day 1 since COR 4 – Typhoon Champi

(Fadian, Mangilao) – The Guam Power Authority (GPA) continues its power restoration process and have made progress to its post-typhoon recovery. In an effort to keep the public updated, we'll continue to provide a recovery summary that summarizes our restoration progress to the Island-Wide Power System (IWPS).

Crews are working a minimum of 12-16 hours, day and evening shifts to ensure continuous 24/7 restoration operations.

Impacts from Typhoon Champi - Recovery Summary
As of 7:00 a.m., Monday, October 19, 2026

IWPS	PERCENTAGES
Transmission Lines Restored (50 each)	**90%**
GPA Substation Energized (30 each)	**100%**
GPA Feeders/Circuits Energized (67 each)	**70%**

GENERATION CAPACITY	MW / PERCENTAGE
Current Peak Demand *(Targeted Demand: 174MW)* ***(Current percentage of normal peak demand)***	**90 / 52%**

Feeders/Circuits: A total of 47 feeders/circuits are energized or partially energized of the 67 distribution feeders/circuits.
Substations: All 30 critical substations are energized.
Generation Capacity: Adequate. (GPA does not anticipate any generation capacity shortage.)
Inventory Status: Adequate. (GPA has adequate inventory to ensure that critical materials and supplies are readily available when needed.)

Today's Key Objectives and Other Power Related Updates:

- Line crews have begun restoration work on distribution lines and feeders/circuits in villages.
- Generation personnel continue to address generators for water wells and waste water service.
- Continue working on urgent critical infrastructure and facilities across the island.
- During this stage of recovery, some energized feeders may still leave pockets of isolated customers with extensive damages. GPA will return to restore service to those remaining customers immediately after all other feeders without faults are restored.

Please stay away from all down lines and equipment as they may still be energized and can cause harm if you come in contact with the lines or equipment. Consider such situations as dangerous and life threatening. **To report downed power lines or for emergency power issues**, call GPA Trouble Dispatch at (671) 475-1472/73/74.

Customers may report **non-emergency power issues** - such as damaged weather heads, internal electrical damage requiring Emergency Work Clearances, or inquiries about service restoration - to GPA's Customer Call Center at (671) 647-5787/88/89, email at customersfirst@gpagwa.com or sending a direct message to GPA's Facebook page. The Customer Call Center will continue to operate 24/7 throughout the post-typhoon recovery period.

GPA understands that residents are eager to have service fully restored and thanks the community for the outpouring of support shown to crews working in villages across the island. **Residents are asked to allow crews to work unimpeded. While crews understand the urgency and concerns, stopping them to ask about restoration timelines delays progress and creates safety risks**. Allowing crews to continue their work and focus on their tasks at hand while concentrating on repairs will help ensure power is restored as quickly and safely as possible.

GPA will continue providing daily updates as restoration efforts progress. GPA thanks our customers for their patience and asks for their continued support as we work to bring our IWPS back to normal operations as quickly as possible.

HOW POWER IS RESTORED
AFTER TROPICAL STORMS AND TYPHOONS

How GPA Restores Power to Your Home

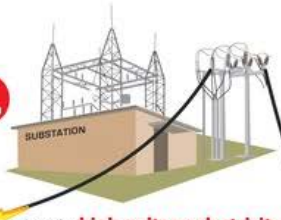

To restore service as quickly as possible, GPA must repair all components in the prioritized order shown below.

1. The first priority in recovery is to restore **GPA Power Plants** that generate electricity. GPA Power Plants use fossil fuel, solar and wind sources.

2. The **transmission lines** route the power from the plants to the various substations throughout the island.

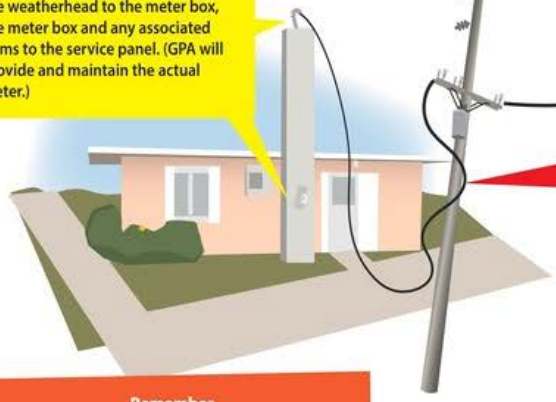

3. When the **high-voltage electricity** reaches one of the **GPA Substations**, the voltage is lowered so it can be sent to smaller transformers on poles or concrete pads for servicing homes or other buildings via the distribution system. These substations are located in the villages all over the island.

4. The **Distribution Lines and Power Poles** that run along neighborhood streets carry the electricity to homes, buildings, traffic lights and street lights.

5. Proper Services Connections that **homeowners must maintain** are the weatherhead, the lines from the weatherhead to the meter box, the meter box and any associated items to the service panel. (GPA will provide and maintain the actual meter.)

Service Lines run from the Power Pole onto your property. **GPA maintains these lines, but homeowners must maintain proper service connections.** (See the illustration to identify what type of service connection you have and learn what your responsibilities are.)

Remember,

HIGH VOLTAGE KILLS

Downed or dangling power lines can cause electrocution

After the storm passes, look around and be alert for fallen or downed power lines. Consider ALL fallen lines to be "live" to avoid severe injury or death.

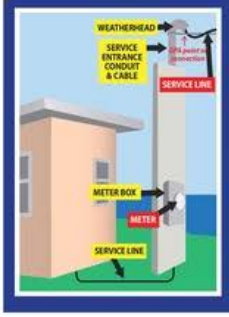

Electricity travels through standing water and can cause electrocution

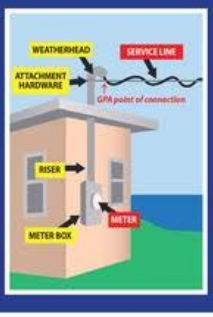

Avoid flooded areas even if they are shallow. Don't step into water in case a downed power line is touching it. Remember, the power line may be some distance away or even out of sight.

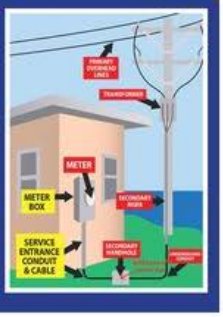

Who is Responsible for Fixing What?

If your electrical components are damaged, you may be responsible for repairs. Identify your type of service connection below to learn more.

CUSTOMER'S RESPONSIBILITY | **GPA'S RESPONSIBILITY**
